

SMS FoxBox Description

Description

SMS FoxBox is a tiny Linux-based gateway to send and receive SMS messages using a commercial SIM card from Web, mail server, widget, desktop or network applications. SMS FoxBox includes a GSM quad band modem, a SD/MMC memory card to store the messages (up to 2 million with the default 1GByte card) and an Apache Web server to manage the SMS queues by means of an easy to use Web interface.

SMS FoxBox can also operate as an SMS to TCP/IP gateway to integrate a wide range of network and desktop applications with the SMS messaging. [Documentation index](#)
